                                                                                                                                                                                                                                                                                                  factor: FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (TF) and for treating a TF/FVIIa mediated disease or disorder in a host. Diseases which can be treated include chronic thromobembolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arterioscelerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angiopedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa
                                                                                                                                                                                                                           Sequence 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New factor VIIa antagonist peptide for research, diagnostic, therapeutic and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Dennis MS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  06-AUG-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to evaluating the efficacy of molecule against a target population including a pest strain resistant to first toxin. The method involves determining pest strain susceptible to the first toxin, selecting strain resistant to first toxin, and evaluating the efficacy of resistant strain with molecules to determine second toxin that is more toxic to resistant strain than to susceptible strain. The resistant and susceptible strains co-exist in the target population. The method is useful for evaluating the efficacy of molecule against a target population comprising pest strain resistant to first toxin, e.g. insect population, mammalian population, plant population, animal population, or virus population. The efficacy of molecules to kill unwanted resistant corganisms is increased. Sequences ABR82336-49 represent A-series peptides that inhibit the activation of factor X

The peptides are useful for preventing or treating chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders, such as deep venous thrombosis, arterial thrombosis, stroke, atherosclerosis, or septicaemia. The present sequence represents a tFVII

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation of factor. FVIIa antagonist peptides are useful for inhibiting FVIIa of activity in the presence of a tissue factor (TF) and for treating a TF/FVIIa mediated disease or disorder in a host. Diseases which can be created include chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to evaluating the efficacy of molecule against a target population including a pest strain resistant to first toxin. The method involves determining pest strain susceptible to the first toxin, selecting strain resistant to first toxin, and evaluating the efficacy of resistant strain with molecules to determine second toxin that is more toxic to resistant strain than to susceptible strain. The resistant and susceptible strains co-exist in the target population. The method is useful for evaluating the efficacy of molecule against a target population, mammalian population, plant population, animal population, or virus population. The efficacy of molecules to kill unwanted resistant organisms is increased. Sequences ABR02336-49 represent A-series peptides that inhibit the activation of factor X

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to peptide antagonists of tissue Factor VIIa (fFVIIa) and a method of inhibiting FVIIa activity by contacting FVIIa with the peptide in the presence of tissue factor and under conditions that allow binding of the compound to FVIIa to occur. The peptides are useful for preventing or treating chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders, such as deep venous thrombosis, arterial thrombosis, stroke, atherosclerosis, or septicaemia. The present sequence represents a tFVIIa peptide antagonist of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to peptide antagonists of tissue Factor VIIa ([FVIIA]) and a method of inhibiting FVIIA activity by contacting FVIIA with the peptide in the presence of tissue factor and under conditions that allow binding of the compound to FVIIA to occur. The peptides are useful for preventing or treating chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders, such as deep venous thrombosis, arterial thrombosis, stroke, atherosclerosis, or septicaemia. The present sequence represents a tFVII.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New peptide, useful for preventing or treating chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders, such as deep venous thrombosis, arterial thrombosis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tissue

                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to peptide antagonists of tissue Factor VIIa (tFVIIa) and a method of inhibiting FVIIa activity by contacting FVIIa with the peptide in the presence of tissue factor and under conditions that allow binding of the compound to FVIIa to occur. The peptides are useful for preventing or treating chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders, such as deep venous thrombosis, arterial thrombosis, stroke, atherosclerosis, or septicaemia. The present sequence represents a tFVII. peptide antagonist of the invention.
                                                   Antagonist; factor VIIa; FVIIa; blood coagulation factor; inhibitor; chronic thromobembolic disease; fibrin formation; vascular disorder; deep vein thrombosis; arterial thrombosis; stroke; metastasis; thrombolysis; arteriosclerosis; restenosis; inflammation; septic shows septicaemia; hypotension; angioedema; ARDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide, useful for preventing or treating chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders, such as deep venous thrombosis, arterial thrombosis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tissue Factor VIIa; tFVIIa; chronic thromboembolic disease; fibrin formation; vascular disorders; deep venous thrombosis; arterial thrombosis; stroke; atherosclerosis; septicaemia.

FVIIa is a trypsin-like serine protease blood coagulation CC factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (TP) and for treating a CC TP/FVIIa mediated disease or disorder in a host. Diseases which can be CC treated include chronic thromboshoblic diseases or disorders associated CC with fibrin formation including vascular disorders such as deep venous CC indications such as inflammation, settoke, tumour metastasis, thrombolysis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, CC indications such as inflammation, septic shock, septicaemia, hypotension, CC cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory CC distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) CC and other diseases like inflammatory disorders. The antagonist peptides CC are also useful in research, and for disgnostic, therapeutic and CC prophylactic purposes. The present sequence represents a factor VIIa arterial peptide of the invention
                                                                                                                                                                                                                                                                                                                                                              RESULT 11

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to evaluating the efficacy of molecule against a target population including a pest strain resistant to first toxin. The method involves determining pest strain susceptible to the first toxin, selecting strain resistant to first toxin, and evaluating the efficacy of resistant strain with molecules to determine second toxin that is more toxic to resistant strain than to susceptible strain. The resistant and susceptible strains co-exist in the target population. The method is useful for evaluating the efficacy of molecule against a target population, mammalian population, plant population, animal population, or virus population. The efficacy of molecules to kill unwanted resistant organisms is increased. Sequences ABR82336-49 represent A-series peptides that inhibit the activation of factor X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Evaluating the efficacy of molecule against target population including toxin-resistant pest strain, by determining susceptible pest strain, selecting resistant strain, and evaluating efficacy of resistant strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2003-598567/56.

New factor VIIa antagonist peptide for research, diagnostic, therape and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation.

therapeutic

Ģ.

CC (FWIIa). FVIIa is a trypsin-like serine protease blood coagulation CC (FWIIa). FVIIa is a trypsin-like serine protease blood coagulation CC factor: FVIIa antagonist peptides are useful for inhibiting FVIIa CC activity in the presence of a tissue factor (TF) and for treating a CC TF/FVIIa mediated disease or disorder in a host. Diseases which can be CC treated include chronic thromobembolic diseases or disorders associated CC with fibrin formation including vascular disorders such as deep venous CC thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, CC arteriosclerosis and restenosis following angloplasty, acute and chronic CC indications such as inflammation, septic shock, septicaemia, hypotension, CC cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory CC distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) CC and other diseases like inflammatory disorders. The antagonist peptides CC are also useful in research, and for diagnostic, therapeutic and CC prophylactic purposes. The present sequence represents a factor VIIa

antagonist peptide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to evaluating the efficacy of molecule against a target population including a pest strain resistant to first toxin. The method involves determining pest strain susceptible to the first toxin, selecting strain resistant to first toxin, and evaluating the efficacy resistant strain with molecules to determine second toxin that is more toxic to resistant strain than to susceptible strain. The resistant and susceptible strains co-exist in the target population. The method is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      susceptible strains co-exist in the target population. The method is useful for evaluating the efficacy of molecule against a target population comprising pest strain resistant to first toxin, e.g. insect population, mammalian population, plant population, animal population, or virus population. The efficacy of molecules to kill unwanted resistant organisms is increased. Sequences ABR82336-49 represent A-series peptides that inhibit the activation of factor X
                                                                    Evaluating the efficacy of molecule against target population including toxin-resistant pest strain, by determining susceptible pest strain, selecting resistant strain, and evaluating efficacy of resistant strain
                                                                                                                                                                                                                                                 30-JUL-2001; 2001US-0308790P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    method involves determining pest strain resistant to first toxin. The method involves determining pest strain succeptible to the first toxin, selecting strain resistant to first toxin, and evaluating the efficacy of resistant strain with molecules to determine second toxin that is more toxic to resistant strain than to susceptible strain. The resistant and susceptible strains co-exist in the target population. The method is useful for evaluating the efficacy of molecule against a target population comprising pest strain resistant to first toxin, e.g. insect population, mammalian population, plant population, animal population, or the efficacy of molecules to kill unwanted resistant organisms is increased. Sequences ABR82336-49 represent A-series peptides that inhibit the activation of factor X
                      The invention relates to evaluating the efficacy of molecule against a target population including a pest strain resistant to first toxin. The method involves determining pest strain susceptible to the first toxin, selecting strain resistant to first toxin, and evaluating the efficacy of resistant strain with molecules to determine second toxin that is more toxic to resistant strain than to susceptible strain. The resistant and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              អន្តិ និង្សា និង្សា
                       This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation of factor. FVIIa antagonist peptides are useful for inhibiting FVIIa cardivity in the presence of a tissue factor (TF) and for treating a CC TFF/FVIIa mediated disease or discorder in a host. Diseases which can be treated include chronic thromobembolic diseases or discorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tunour metastasis, thrombolysis, carteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angiopdema, adult respiratory constructs syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for dispositic, therapeutic and compared to the coagulapathy (DIC) and other diseases of the inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                X S
                                                                                                                                                                  This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation of factor. FVIIa antagonist peptides are useful for inhibiting FVIIa cativity in the presence of a tissue factor (TF) and for treating a TF/FVIIa mediated disease or disorder in a host. Diseases which can be treated include chronic thromboshoblic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ś
                                                                                                                                                                                     This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation (C factor. FVIIa antagonist peptides are useful for inhibiting FVIIa (C factor. FVIIa mediated disease or disorder in a host. Diseases which can be treated include chronic thromboembolic diseases or disorders associated (C treated include chronic thromboembolic diseases or disorders associated (C with fibrin formation including vascular disorders such as deep venous (C thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, creations such as inflammation, septic shock, septicaemia, hypotension, (C indications such as inflammation, septic shock, septicaemia, hypotension, (C ardiopulmonary bypass surgery, hereditary angioedema, adult respiratory (C distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) (C and other diseases like inflammatory disorders. The antagonist peptides (C are also useful in research, and for disgnostic, therapeutic and (C prophylactic purposes. The present sequence represents a factor VIIa

                                                                                                                                    밁
                                                                                                                                                                                                                                                                                               This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation CC factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (TF) and for treating a CC TF/FVIIa mediated disease or disorder in a host. Diseases which can be CC treated include chronic thromboshoblic diseases or disorders associated CC with fibrin formation including vascular disorders such as deep venous CC thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, CC arteriosclerosis and restenosis following angioplasty, acute and chronic CC indications such as inflammation, septic shock, septicaemia, hypotension, CC cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory CC distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) CC and other diseases like inflammatory disorders. The antagonist peptides CC are also useful in research, and for diagnostic, therapeutic and CC prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention
                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation CC factor. FVIIa antagonist peptides are useful for inhibiting FVIIa CC activity in the presence of a tissue factor (TF) and for treating a CC TF/FVIIa mediated disease or disorder in a host. Diseases which can be CC treated include chronic thromobembolic diseases or disorders associated CC with fibrin formation including vascular disorders such as deep venous CC thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, CC arteriosclerosis and restenosis following angioplasty, acute and chronic CC indications such as inflammation, septic shock, septicaemia, hypotension, CC cardiopulmonary bypass surgery, hereditary angiopedema, adult respiratory CC distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) CC are also useful in research, and for diagnostic, therapeutic and CC prohlylactic purposes. The present sequence represents a factor VIIa
                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to peptides which act as antagonist of Factor VIIa ([FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa cativity in the presence of a tissue factor (TF) and for treating a TF/FVIIa mediated disease or disorder in a host. Diseases which can be treated include chronic thrombombolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation CC factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (TF) and for treating a CC TF/FVIIa mediated disease or disorder in a host. Diseases which can be CC treated include chronic thromobembolic diseases or disorders associated CC with fibrin formation including vascular disorders such as deep venous CC thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, CC arteriosclerosis and restenosis following angioplasty, acute and chronic CC indications such as inflammation, septic shock, septicaemia, hypotension, CC cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory CC distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) CC and other diseases like inflammatory disorders. The antagonist peptides care also useful in research, and for disgnostic, therapeutic and correctly of the contravascular coagulapathy (DIC) are also useful in research, and for disgnostic, therapeutic and the coagulapathy (DIC) are also useful in research, and for disgnostic, therapeutic and the coagulapathy (DIC) are also useful in research, and for disgnostic, therapeutic and the coagulapathy (DIC) are also useful in research, and for disgnostic, therapeutic and the coagulapathy (DIC) are also useful in research, and for disgnostic, therapeutic and the coagulapathy (DIC) are also useful in research, and for disgnostic, therapeutic and the coagulapathy (DIC) are also useful in research, and for disgnostic, therapeutic and the coagulapathy (DIC) are also useful in research, and for disgnostic, therapeutic and the coagulapathy (DIC) are also useful in research and the coagulapathy (DIC) are also useful in research and the coagulapathy (DIC) are also useful in research and the coagulapathy (DIC) are also useful in research and the coagulapathy (DIC) and the coagulapathy (DIC) are coagulapathy (DIC
                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                              Query Match

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB seq
